

## **We've got the power!**

Deutz is famous for its engines; it's that simple. These engines are known to be highly reliable, durable and of great quality. The latest venture for Deutz has seen them use these world famous air cooled diesel engines of the 91x- series, and put them in their own inhouse power generating sets.

When working on the design and technical capabilities of the generators, Deutz were conscious of the following factors:

- They wanted to create a prime and continuous power supply
- It needed to have a compact configuration
- It was to be simple and easy to maintain
- They wanted low operation costs
- Application under extreme conditions
- And finally it had to be best value for money

Now this may seem like quite a lot to achieve from one generator but when looking at what Deutz has now come up, it seems as though they may have just done it!

The generator is based on a three platform strategy; one platform each for three, four and six cylinder engines. The innovative and highly functional design is fully aligned to the specific benefits of air-cooled Deutz engines. Thus Deutz have released a much compactor configuration compared to the competition.

Deutz have designed this generator to lead the market and some of the features it boasts include soundproof gensets for extreme environmental conditions, a trouble free cooling system where the air neither cooks nor freezes, optimised service accessibility and a prime and continuous power supply. Combine all this with the exciting modern industrial design and the high capacity fuel tank for a maximum of autonomy and we're confident that this range of generators will lead the market.
